

Introduction to Environmental Studies

Environmental Studies is a subject that helps students understand the world around them. It explains how humans, plants, animals, and natural resources are connected to each other. EVS teaches children about nature, health, society, and responsible living. The subject encourages students to observe their surroundings, ask questions, and develop good habits that help both people and the environment.

By studying EVS, students learn not only facts but also values such as cleanliness, care for nature, cooperation, and responsibility. The subject helps children become aware citizens who respect life and the planet.

Living and Non-Living Things

Everything around us can be divided into living and non-living things. Living things include humans, animals, plants, birds, and insects. They have certain characteristics such as growth, breathing, movement, need for food, and reproduction. Living things respond to their surroundings and can feel changes in the environment.

Non-living things do not show these characteristics. Objects such as stones, tables, chairs, books, and vehicles do not grow, breathe, or reproduce. They do not need food or air to survive. Understanding the difference between living and non-living things helps students recognize life and appreciate living beings.

Some things, like seeds, may not show movement but are still living because they can grow under suitable conditions. This helps students learn that movement alone does not decide whether something is living or not.

Plants Around Us

Plants are one of the most important living things on Earth. They provide food, oxygen, medicines, wood, and shelter. Plants make their own food using sunlight, water, and air. This process helps keep the environment balanced and supports all other living beings.

Different parts of plants perform different functions. Roots hold the plant in the soil and absorb water. Stems support the plant and carry water and nutrients. Leaves prepare food for the plant. Flowers help in the reproduction of plants.

Plants also help in cleaning the air by absorbing harmful gases and releasing oxygen. Without plants, life on Earth would not be possible. EVS teaches students to protect plants and understand the importance of planting trees.

Animals and Their Homes

Animals live in different types of homes depending on their needs and surroundings. Homes protect animals from heat, cold, rain, and enemies. For example, lions live in dens, birds build nests, cows live in sheds, and dogs stay in kennels.

Some animals build their own homes, while others use natural shelters. The type of home an animal lives in depends on its body, habits, and environment. Learning about animal homes helps students understand how animals survive in nature and why they need protection.

Animals are an important part of nature. They help maintain balance in the ecosystem and support human life in many ways.

Food We Eat

Food is essential for all living beings. It gives us energy to grow, work, and stay healthy. EVS explains different types of food and their importance.

Food comes from plants and animals. Rice, wheat, fruits, and vegetables come from plants, while milk, eggs, and meat come from animals.

A balanced diet includes fruits, vegetables, grains, and proteins. Eating healthy food helps protect the body from diseases. EVS teaches students the importance of clean food and good eating habits.

Our Body and Health

The human body is made up of many parts that work together. EVS introduces students to basic body parts and their functions. Good health depends on proper food, exercise, rest, and cleanliness.

Personal hygiene such as washing hands, brushing teeth, and bathing regularly keeps the body healthy. Exercise strengthens muscles and bones. Sleep helps the body rest and grow. Students learn that good habits lead to a healthy life.

Air Around Us

Air is present everywhere around us. Although we cannot see air, we can feel it. Air is needed for breathing and burning. All living beings need air to survive.

Clean air keeps us healthy, while dirty air causes breathing problems and diseases. Smoke from vehicles and factories pollutes the air. EVS teaches students the importance of keeping the air clean by planting trees and reducing pollution.

Water – Our Lifeline

Water is essential for life. We use water for drinking, cooking, washing, and farming. Sources of water include rivers, lakes, wells, and rain. Clean water keeps us healthy, while dirty water causes diseases.

Water should not be wasted. EVS teaches students ways to save water at home and in school. Protecting water resources is important for future generations.

Cleanliness and Waste Management

Clean surroundings help prevent diseases. Waste should be thrown in dustbins and separated into wet and dry waste. Recycling helps reduce pollution and saves resources.

EVS encourages students to keep their homes, schools, and neighborhoods clean. Clean habits make the environment safe and healthy.

Family, Community, and Care for Earth

Family and community play an important role in a child's life. EVS teaches cooperation, sharing, and respect for others. Students learn that caring for the Earth is everyone's responsibility.

Protecting plants, animals, air, and water helps keep the planet healthy. EVS develops awareness and responsibility in young minds.
